Dear Hiring Manager,

I am a Software Engineering graduate applying for a Junior Software Developer position within your organization. Through hands-on academic and independent projects, I have built full-stack web applications and Android-based systems, gaining practical experience in Java, PHP, MySQL, and JavaScript.

One of my key projects includes developing a full-stack e-commerce platform where I designed the database schema, implemented authentication, and structured scalable CRUD operations. I also developed an Android mobile application integrating real-time API data for EV charging locations and load-shedding schedules. These projects strengthened my ability to apply object-oriented principles, manage structured data, and build user-focused solutions.

Beyond technical skills, I bring accountability and leadership experience as a Class Representative and Golden Key Honour Society member. I am disciplined, detail-oriented, and comfortable collaborating in team environments.

I am eager to contribute to real-world development projects, write production-quality code, and continue developing within a growth-focused technical team. I would welcome the opportunity to discuss how I can contribute to your organization.

Thank you for your time and consideration.

Sincerely,

Anje Nieuwenhuis
